

Yet these cases are seldom reported. Also seldom reported are the approximately 5% of atypical measles cases occurring later in the vaccinated. 5% of 4 million born per year is 200,000 measles cases per year in the vaccinated in the USA in addition to the cases caused by the vaccination. Yet what we see in newspapers, broadcast media or official pronouncements are the few measles cases occurring in the non-vaccinated. (10)

Ten Vaccination Related Beliefs versus Science Facts

The Vaccination Paradigm is a Belief System. Are these beliefs proven or refuted by real science and inconvenient facts?

1) Belief: Vaccination saved millions of lives. Fact: Sanitary Reforms and Nutritional Improvements from the 1700's onward, including street cleaning, garbage collecting, cleaner water, sewage treatment, wider sunlit streets and year around availability of fresh fruits and vegetables saved millions of lives. (1)

2) Belief: Germ Theory states Virus and Bacteria (microbes) are the Primary cause of Disease. Fact: The Terrain Theory and Human Biome Research explain childhood diseases better than the Germ Theory. Recent Biome research has proven that various microbes live in harmony within healthy human bodies. Poor elimination causes the body to accumulate toxic debris, the breeding ground for "pathogenic" microbes. Toxic disease conditions are the real cause of disease and microbe proliferation . (2)

3) Belief: Antibody Theory adequately explains protection against infectious diseases. Fact: Antibodies are not the Immune system although they undoubtedly play a small part in immunity. Individuals can be immune even if they have no specific antibodies and likewise even if their bodies are unable to create antibodies specific to the antigens (microbes) of interest. (3)

4) Belief: Vaccinations are Effective at preventing disease. Fact: Vaccination Changes the bloodstream of vaccine recipients but those changes (creation of antibodies) are **not the same as the antibodies leftover after disease** and, in fact, bias the immune system toward allergies and asthma. Blood changes following vaccination are **not beneficial**. True effectiveness of vaccines is not measured before marketing, therefore, vaccine created immunity is a fiction. (4) [See 5) on poison tolerance.]

5) Belief: Vaccination creates immunity. Fact: Vaccination creates poison tolerance.

Is the following True or False?

Smoking a pack of cigarettes per day prevents the diseases caused by smoking a pack of cigarettes per day.

Do you agree that the above statement is false? Well then, what about this one: *Injecting virus or bacteria into the body prevents the disease caused by those virus or bacteria.* Nonsense, right?

Vaccination creates a condition of Poison Tolerance which to the casual observer (or the fraud promoter) looks enough like “immunity” to fool science specialists, public health officials, legislators, journalists and the general public. In reality, vaccines interfere with **healing** making true healing slower, less effective and sometimes non-existent resulting in **vaccinated individuals experiencing more disease, including chronic disease, but less healing than never-vaccinated individuals.** (5)

6) Belief: Vaccines are thoroughly tested and proven safe before marketing. Fact: Vaccine Testing is fraudulent. Vaccine testing typically uses no real placebos. Instead, vaccines are compared to other vaccines or toxic vaccine ingredients; effectiveness is measured with a false surrogate; voluntary reporting means most adverse effects are not reported. During the manufacturer’s trials, monitoring occurs for a short period of time; doctors supervising vaccine trials commonly deny that adverse effects following vaccination are related to the vaccination, and efforts to avoid performing a study comparing the health of the never-vaccinated and vaccinated persists. (6)

7) Belief: Microbes determine severity of disease. Fact: It is the host (the terrain), not the microbe that determines disease severity. (7)

8) Belief: It is necessary to vaccinate over 90% of children to create Herd Immunity. Fact: Vaccines do not create either individual or herd immunity.

There are three kinds of herd immunity: *Real Herd Immunity*, *Theoretical Herd Immunity* and *Propaganda Herd Immunity*.

Real herd immunity begins in the soil. When the soil is rich in nutrients, the plants are healthy and the consumer of those plants will be healthy and immune.

Theoretical herd immunity was a concept created by a researcher named Hedrich observing cycles of a few measles cases one year followed by a measles epidemic another year and theorizing that outbreaks would not occur when **natural** herd immunity was above 68%.

Propaganda herd immunity ignores the fact that in a sanitary and well-fed society, most individuals are naturally immune. Vaccine proponents also ignore the fact that vaccines are not effective in preventing disease or its transmission. Outbreaks often occur in 100% vaccinated populations proving vaccine-induced herd immunity to be an illusion. (8)

9) Belief: Vaccines prevent disease transmission. Fact: Vaccinated individuals shed more viral particles than the non-vaccinated. Precursors to vaccination have existed for at least 2000 years, but the concept of vaccination as a means of disease prevention became wide spread after Jenner extracted pus and blood from the sores of sick cows, then put this waste material into the arms of human beings, claiming it would prevent smallpox for life. Later others claimed it also eradicated that disease by preventing viral transmission. This lie continues today even as officials have proof available that vaccination with live virus vaccines is followed by shedding. (9)

10) Belief: Reporting Systems are Honest and Reliable. Fact: Many recognized cases of disease are not reported even when recognized. Adverse vaccine outcomes are denied and information is suppressed. Live “attenuated” virus injections (Measles, Mumps, Rubella, Chicken Pox, etc) are followed by visible cases in the two weeks following vaccination.
